VIRUSES, NUCLEIC ACIDS, AND CANCER

Facts, ideas, theories, discussions presented by 78 internationally known cancer researchers, and converging on the solution of the human cancer problem, make this book a relatively complete picture of all now known in the field. The viral concept of oncogenesis, applied to human cancer, is still only a working hypothesis. Many basic and unanswered questions block access to an ultimate solution. During this symposium, reports on recent work were given, and partial answers supplied to some of the problems cancer researchers are focusing on today.

A thorough, practical study...

Corscaden: GYNECOLOGIC CANCER, 3rd edition

The importance of early diagnosis in the care and cure of female cancers is gaining recognition and acceptance by gynecologists, general practitioners, and the public. More than six million American women will have the Papanicolaou smear test this year. Yet, more than 40 million should have this test but do not—many of these women have never even heard of it.

Dr. James A. Corscaden shows great concern about this problem. Dr. Corscaden was one of the early advocates of early diagnosis and early treatment for cancers of the female productive organs. In his new third edition of Gynecologic Cancer, he explains in detail, tested methods of diagnosis and treatment, giving careful attention to new methods developed within the past decade. Evident throughout this book are Dr. Corscaden's broad knowledge of research in his subject and his long experience as both a surgeon and gynecologist.

He is perhaps best known for establishing the Follow Up System in the Surgical Department of the Presbyterian Hospital in New York City and for taking part in the development of the Unit History System, both of which have become standard in most hospitals. Dr. Corscaden established the Department of Radiotherapy at the Presbyterian Hospital and organized and took charge of the Tumor Clinic at the Sloane Hospital for Women.

He has collected many excellent x-rays, diagrams, and photomicrographs which he reproduces in Gynecologic Cancer. Dr. Edmund R. Novak concluded his highly favorable review in Obstetrical and Gynecological Survey of the second edition of this book with the following: "No finer summary or reference text can be found, but above all, it is an eminently well-balanced book with consideration of all means of therapy, but without any undue prejudice or bias. As such it is highly recommended to all doctors who see female patients."

Contents: Introduction • Diagnosis • Cancer of the vulva • Cancer of the vagina • Cancer of the cervix • Cancer of the endometrium. Cancer of the myometrium • Neoplastic diseases of the chorion • Cancer of the fallopian tube • Cancer of the ovary • The menopause • Management of the cancer patient • The nature of cancer • Index.

By James A. Corscaden, Ph.B., M.D., Professor Emeritus of Clinical Gynecology College of Physicians and Surgeons, Columbia University Attending Gynecologist, Sloane Hospital for Women, New York

INSTRUCTIONS FOR AUTHORS

Manuscripts for Cancer Research must represent new and original contributions not previously published and, if accepted, not to be published elsewhere. They must be typed, double-spaced (including references, footnotes, and tables), with ample margins, on bond paper. The original and one clear copy of the entire manuscript, including figures and charts, must be submitted. All pages should be numbered consecutively. Every paper must begin with a concise summary of the essential results of the investigation.

Supplements on Cancer Chemotherapy Screening Data: Authors who wish to submit data for publication in these supplements, which appear at least six times a year, are urged to consult the Instructions for the preparation of such material, found on the inside back cover of most of these supplements.

Critical reviews on subjects dealing with cancer and allied fields will be considered for publication. Such reviews should attempt to correlate the various approaches to a problem so as to indicate the trends and emphasize the aspects that require further clarification. Critical analyses of the pertinent issues and expressions of opinions are encouraged.

The title of the paper should be as short as is compatible with a clear indication of the subject matter. The title (with subtitle, if any) must not exceed 150 characters and spaces. Chemical formulas should not be included in the title. The title of the paper, author (or authors), location, and any acknowledgments should appear on separate pages.

Footnotes within the text should be numbered consecutively and should appear on a separate sheet.

Tables should be typed, double-spaced throughout, on separate sheets and should be numbered. Each must have a brief, descriptive title. Tables should be arranged for vertical position on the page. Every column must be supplied with an appropriate heading, and units of measure must be clearly indicated. The same data may be presented in either chart or tabular form, but not in both. Tables should be intelligible without reference to the text.

Illustrations: The preparation of photographs, charts, and graphs is particularly important, and authors are requested to follow carefully the directions given below.

Halftone illustrations (photomicrographs and photographs) are designated figures and are printed as plates at the end of each article. Figures in moderate numbers will be accepted if they are of good technical quality and essential for the clarity of the presentation. Figures should be trimmed to show only the essential features; all parts of each figure must be in sharp focus. Only clear, glossy photographs should be submitted. Mount all photographs on white cardboard (8½X11 inches in size), with the edges abutting tightly. The engraver will then draw a thin line between adjoining figures. Place as many together as will make a plate not to exceed 7½X9½ inches. Figures should be numbered consecutively. Photographs of plates should accompany the second copy of the manuscript. Legends for plate figures should be typed separately, in consecutive order, on standard-sized paper with the heading “Legends for Figures.”

Line-cut illustrations (graphs and charts) are designated charts and are printed in the text. These should be numbered in consecutive order. Charts should be planned so as to eliminate waste space; they must be ruled off close to the area of the curves, and descriptive matter must not extend beyond the curves. Charts must be so prepared that no letter or figure will be less than 2 mm. high after reduction. The majority of charts can be reduced to a one-column (3½-inch) width, but larger ones are permissible when many data are included in one chart. Original line drawings on high-quality white drawing paper or board, blue tracing cloth, or coordinate paper printed in blue should be used. Only India ink should be used for drawing or lettering. Photographs of the charts should accompany the second copy of the manuscript. Legends for each chart should be typed separately in consecutive order on standard-sized paper with the heading “Legends for Charts.” The over-all size of mounted charts and plates must not exceed 8½X11 inches. When original drawings exceed this size, photographed reductions must be sent.

References must be typed double-spaced and should include, in order: author, title, journal abbreviation (Chemical Abstracts form), volume number in Arabic numerals, inclusive pages, and year. Book references should give: author, title, pages, edition number, city, publisher, and year. All references should be checked with the original publications and must be arranged in alphabetical order. Each number in the references is to refer to only one paper. Unpublished data and personal communications may not be included in “References” but must be listed as footnotes. For an example of the correct style, refer to any current issue of Cancer Research.

Changes in proof: Any but minor changes from the manuscript which are made in proof will be billed to the author.

Reprints may be ordered before publication, according to a schedule of prices accompanying the galley proof of the article.

Manuscripts and correspondence related to contributions should be addressed to: Dr. Harold P. Rusch, Editor, Cancer Research, McArdle Memorial Laboratory, Madison, Wisconsin 53706.
