INSTRUCTIONS FOR AUTHORS

Reports on observations in laboratory, clinical, or statistical cancer research and critical reviews, must be original and submitted exclusively to CANCER RESEARCH. Submit double-spaced typed original and 1 copy, complete with figures and charts, in English only, on 8½ x 11 inch paper.

Title and byline: Brief but informative. Author’s name and institution on separate page; acknowledgments on another separate page.

Summary: Informative, 250 words or less, on separate page.

Text: Follow style and arrangement of recent issues. Type footnotes, numbered alphabetically, on a separate page. Follow Webster’s International Dictionary in matters of spelling, punctuation and hyphenation. Follow Chemical Abstracts for chemical terms.

Tables: Should be numbered, typed on separate sheets, and arranged vertically. Title should be descriptive, all columns should have headings, abbreviations explained in footnotes to table, units of measure should be clear. Same data should not be repeated in charts.

Charts: Graphs, line-cut illustrations are printed in the text, numbered consecutively. They should be planned to be reducible, usually to a one-column width (3½ in.); lettering must be 2 mm (½ inch) or higher after reduction. Original line drawings in black India ink are preferred; glossy prints are acceptable, if sharp and black. Type legend for each chart on separate page.

Figures: Illustrations, photomicrographs, photographs are printed as plates at end of article. They must be clear and relevant; color plates are accepted only if essential and are paid for by author. Glossy, correctly trimmed photographs are mounted on white cardboard, 8½ x 11 in. the area for figures not to exceed 7½ x 9½ inches. Number each figure on plate. Legend for each figure is typed on separate pages, in consecutive order. Figures will be considered only if essential for the data.

References: Type double-spaced, numbered in alphabetical order of first author, giving author, title, journal, volume, inclusive pages, and year. For book references, give author, title, pages, edition number, city, publisher and year. Check all references. Follow Chemical Abstracts for abbreviations of journals. Unpublished data and personal communications are listed in parentheses in text, not in references.

Changes in proof: Any but minor changes from the manuscript made in proof will be billed to the author.

Reprints: Should be ordered before publication, according to a schedule of prices accompanying the galley proof of the article.

Manuscripts and correspondence related to contributions should be addressed to: Dr. Michael B. Shimkin, Editor, Cancer Research, Fels Research Institute, Temple University School of Medicine, Philadelphia, Pennsylvania 19140.

Subscriptions and business inquiries should be addressed to the publishers, The Williams & Wilkins Co., 428 E. Preston St., Baltimore, Maryland, U.S.A., 21202.
NEW REAGENT FOR AMINO ACIDS AND PEPTIDES

PICRYL SULFONIC ACID (2, 4, 6 Trinitrobenzene Sulfonic Acid) reacts specifically with primary amines, amino acids and peptides. Extinction coefficients of the products run from 0.98 to 1.12 x 10^4 for amino acids at a final concentration of N.

This new reagent proved advantageous in the assay of peptides due to similarity of color intensity among various peptides. Trinitrophenyl peptides derivative can be split easily after assay of chromatographic effluent with ammonia.

For example: 1.0 ml of amino acid or peptide (0.01 to 0.08 mMol), 1.0 ml of 4% NaHCO3, 1.0 ml of 0.1% picryl sulfonic acid is kept in dark for two hours at 40°C; acidified with H N HCL and optical density measured at 340 μm (1).

SPECIFIC STAIN FOR SH GROUPS IN TISSUES

MERCURY ORANGE (1, (4 Chloromercuri Phenylazo) 2 Naphthol Red Sulphhydryl Reagent).

Bennett reported that Mercury Orange is specific for attachment solely to SH groups in tissues (1) (2).

The tissue was fixed in trichloracetic acid, dehydrated in alcohol or prepared by freeze substitution. It was then teased into small fragments. Mercury orange (red sulphhydryl reagent) (RSR) was employed as a saturated solution in solvent.

Using this standard, Bennett located SH groups in regions previously not known to contain them, such as nerve cell bodies, in retinal rods and in capillary endothelium.

After testing a number of reagents, Mauri, Vaccari and Kaderavek concluded that only RSR procedure was sufficiently sensitive and specific for thiols in tissues (3).

PHONE COLLECT, 216-662-0212. NUTRITIONAL BIOCHEMICALS CORP. GUARANTEES SHIPMENT ON ANY OF OUR MORE THAN 3,000 RESEARCH BIOCHEMICALS WITHIN 60 MINUTES OF YOUR CALL. ONE DAY DELIVERY ANYWHERE IN CONTINENTAL U.S.A.
