New Saunders Volumes

_Illuminating current and vital information for the researcher_

**New! Microbial Models of Cancer Cells**

By G. F. GAUSE, Director of the Institute of New Antibiotics of the Academy of Medical Sciences in Moscow.

A valuable new guidebook, Gause’s *Microbial Models of Cancer Cells* provides substantial aid, through the use of microbial models, to the researcher investigating malignant transformation of cells. The author shows how microbial models can help you gain a better understanding of the architecture of deletions in cellular biochemical mechanisms accompanying cancer. The text is based on findings made at the Institute of New Antibiotics in Moscow during the last 10 years. Dr. Gause provides new insights into various aspects of cell transformation: defective control of enzyme synthesis—biosynthetic potentialities accompanying malignization—and distortions in the nucleic acids.

This is the first book in the new series, *Frontiers of Biology*, offering thorough, objective presentations of important and rapidly advancing aspects of biology—especially in the areas of microbiology, biochemistry, and genetics.

97 pp. * Illustrated * $4.50. New—Just Published!

**New! Spontaneous Regression of Cancer**

By TILDEN C. EVERSON, M.D., and WARREN H. COLE, M.D., both of the college of Medicine, University of Illinois.

This scholarly work provides an authoritative study and analysis of a worldwide collection of 176 cases of spontaneous regression of cancer. The authors meticulously report the frequently bizarre details of each patient’s history in which a malignant tumor partially or completely disappeared in the absence of all treatment or when the therapy was generally considered inadequate. Regression is shown to occur most commonly in four types of cancer: hypernephroma, neuroblastoma, malignant melanoma, and choriocarcinoma. All possible causes of regression are evaluated... endocrine influences, fevers, infections, allergic or immune reactions, removal of carcinogenic agent, etc. This beautifully illustrated text enables you to personally analyze and correlate detailed case material with the carefully derived conclusions of the authors.

**New! The Sex Chromatin**

Edited by KEITH L. MOORE, University of Manitoba. 23 eminent contributors.

This new volume illuminates all the significant information gained in recent research on the sex chromatin, and describes its uses in medicine and biology. A wealth of practical help is offered, particularly to those clinicians and investigators interested in sex determination and in abnormalities of the sex chromatin. Among the 23 internationally renowned contributors are Murray Barr and Edwart Bertram—the discoverers of the sex chromatin. Discussions cover such vital topics as: Morphological characteristics of the sex chromatin—Staining affinities and cytochemical properties—Differential diagnosis of sex anomalies—Medico-legal implications—Development of clinical tests—Sex chromatin in amniotic fluid, in embryos and fetal membranes, in transplanted tissues, and in tumors.

**Smolka & Soost:**

**AN OUTLINE AND ATLAS OF GYNAECOLOGICAL CYTODIAGNOSIS**

This is the first English edition of a text which has enjoyed widespread popularity throughout Europe. Now revised, it includes the great advances recently made in fundamental cytological research and in the application of exfoliative cytology to gynecological diagnosis. Recent results and new nomenclature have been included in this revision wherever they could be fitted into the framework of the book. This illustrated outline of gynecological cytology fills the need for a textbook in the field, a need shared by those who are new in the subject, as well as by more experienced cytologists who will find it invaluable for reference purposes.

The book includes detailed discussion and description of normal cells and cell patterns, the knowledge of which is essential for the understanding of abnormal smears; the scope of hormonal and cancer cytology is thoroughly discussed. Drs. Smolka and Soost have employed photomicrographs to show objectively the full range of variations of normal and pathological patterns.

By Horst Smolka, Director of the Department of Obstetrics and Gynecology, Robert Koch Hospital, Gehrdlen/Hanover; and Hans-Jurgen Soost, Research Assistant and Director of the Cytology Laboratory, Hospital for Women, University of Munich.

1965 224 pp., 220 figs. $21.00

INSTRUCTIONS FOR AUTHORS

Reports on observations in laboratory, clinical, or statistical cancer research and critical reviews, must be original and submitted exclusively to CANCER RESEARCH. Submit double-spaced typed original and 1 copy, complete with figures and charts, in English only, on 8½ x 11 inch paper.

Title and byline: Brief but informative. Author's name and institution on separate page; acknowledgments on another separate page.

Summary: Informative, 250 words or less, on separate page.

Text: Follow style and arrangement of recent issues. Type footnotes, numbered alphabetically, on a separate page. Follow Webster's International Dictionary in matters of spelling, punctuation and hyphenation. Follow Chemical Abstracts for chemical terms.

Tables: Should be numbered, typed on separate sheets, and arranged vertically. Title should be descriptive, all columns should have headings, abbreviations explained in footnotes to table, units of measure should be clear. Same data should not be repeated in charts.

Abbreviations: All organic, biochemical, and similar abbreviations used in the text must be explained fully and listed in a common footnote; a single text citation will then suffice.

Unit abbreviations, i.e., μg (not γ), mg, gm, μl, ml, °C, do not require a period. Use liter (no abbreviation), ml (not cc), and cu mm (not mm³). Distinguish clearly between millimole (mmole) and millimolar (mm). Use the style cholesterol-4-14C (not 14C-cholesterol).

Charts: Graphs, line-cut illustrations are printed in the text, numbered consecutively. They should be planned to be reducible, to a one-column width (3½ in.); lettering must be 2 mm (7/16 inch) or higher after reduction. Original line drawings in black India ink are preferred; glossy prints are acceptable, if sharp and black. Type legend for each chart on separate page.

Figures: Illustrations, photomicrographs, photographs are printed as plates at end of article. They must be clear and relevant; color plates are accepted only if essential and are paid for by author. Glossy, correctly trimmed photographs are mounted on white cardboard, 8½ x 11 in. The area for figures not to exceed 7½ x 9½ inches. Number each figure on plate. Legend for each figure is typed on separate pages, in consecutive order. Figures will be considered only if essential for the data.

References: Type double-spaced, numbered in alphabetical order of first author, giving author, title, journal, volume, inclusive pages, and year. For book references, give author, title, pages, edition number, city, publisher and year. Check all references. Follow Chemical Abstracts for abbreviations of journals. Unpublished data and personal communications are listed in parentheses in text, not in references.

Changes in proof: Any but minor changes from the manuscript made in proof will be billed to the author.

Reprints: Should be ordered before publication, according to a schedule of prices accompanying the galley proof of the article.

No responsibility is accepted by the Editors, by Cancer Research, Inc., or by the publishers of CANCER RESEARCH for opinions expressed by contributors.

Manuscripts and correspondence related to contributions should be addressed to: Dr. Michael B. Shimkin, Editor, Cancer Research, Fels Research Institute, Temple University School of Medicine, Philadelphia, Pennsylvania 19140.

Subscriptions and business inquiries should be addressed to the publishers, The Williams & Wilkins Co., 428 E. Preston St., Baltimore, Maryland, U.S.A., 21202.
NBCo adds life blood to leukemia research

Hydroxy urea has been reported effective against the standard L1210 leukemia in mice upon intraperitoneal or oral administration. (1)

Krakoff, et.al., have shown responses from hydroxy urea in chronic granulocytic leukemia. And the substance has also been shown to reduce the rate of incorporation of thymidine H3 into Ehrlich ascites tumor cells in vitro. It appears that part of the carcinostatic action of hydroxy urea is mediated through interference with D.N.A. metabolism. (2)

Give new life to leukemia research in your laboratory. Phone collect, 216-662-0212 (USA) only). NBCo will process your order carefully, efficiently and immediately. NBCo guarantees shipment within 60 minutes of your call; one-day delivery anywhere in the continental USA, 80 hours anywhere in the world. Send for our free catalog containing more than 3000 items.
