### ABOUT THE COVER

Selective antibody-mediated, α-particle–directed killing of LS174T human colon cancer neovascular endothelium using $^{225}$Ac-E4G10 “normalizes” vessels. Animals were treated 15 days before sacrifice and tumors were stained for endothelium (green), pericytes (red), and nuclei (blue). This is a representative cross-section of vessels of $^{225}$Ac-E4G10 treated tumors. More pericytes were associated with endothelial cells when compared with chemotherapy-treated or saline-treated controls. Boxes are 6-μm square. For details, see the article by Escorcia and colleagues on page 9277 of this issue.
