Highlights from Recent Cancer Literature

DNA Damage Response and Growth Factor Signaling Pathways in Gliomagenesis and Therapeutic Resistance

MicroRNA Regulation of Cancer Stem Cells

Circulating Tumor Cell Isolation and Diagnostics: Toward Routine Clinical Use

Systems Biology: Confronting the Complexity of Cancer

Using Tandem Mass Spectrometry in Targeted Mode to Identify Activators of Class IA PI3K in Cancer

Blocking Hypoxia-Induced Autophagy in Tumors Restores Cytotoxic T-Cell Activity and Promotes Regression

MicroRNA Regulation of Cancer Stem Cells

Circulating Tumor Cell Isolation and Diagnostics: Toward Routine Clinical Use

Human NK Cells Are Alerted to Induction of p53 in Cancer Cells by Upregulation of the NKG2D Ligands ULBPI and ULBPII

Activated Notch1 Induces Lung Adenomas in Mice and Cooperates with Myc in the Generation of Lung Adenocarcinoma
Taxane-Induced Blockade to Nuclear Accumulation of the Androgen Receptor Predicts Clinical Responses in Metastatic Prostate Cancer

Précis: This study suggests a histochemical test in circulating cancer cells that could predict therapeutic responses to taxanes used to treat advanced prostate cancer.

Vitamin D3 Enhances the Apoptotic Response of Epithelial Tumors to Aminolevulinate-Based Photodynamic Therapy
Sanjay Anand, Clara Wilson, Tayyaba Hasan, and Edward V. Maytin

Précis: This important study shows how vitamin D3 can be used as a simple, nontoxic, and highly effective preconditioning regimen to enhance the response of epithelial tumors to a combination drug phototherapy, perhaps broadening its clinical applications.

Endothelial Cells Create a Stem Cell Niche in Glioblastoma by Providing NOTCH Ligands That Nurture Self-Renewal of Cancer Stem-Like Cells
Thanh S. Zhu, Mark A. Costello, Caroline E. Talsma, Callie G. Flack, Jessica G. Crowley, Lisa L. Ham, Xiaoqiu He, Shawn L. Hervey-Jumper, Jason A. Heth, Karin M. Muraszko, Francesco DiMeco, Angelo L. Vescovi, and Xing Fan

Précis: This important human study expands concepts of how the tumor endothelium supports cancer growth, in providing not only a blood supply but also a niche to feed self-renewal of cancer stem-like cells.

Vascular Endothelial Growth Factor (VEGF) and the VEGF Receptor: Potential Targets for Antiangiogenic Therapy
Richard D. Schulte, William J. Conney, and Richard D. Schulte

Précis: This review provides an extensive overview of the past, present, and future of antiangiogenic therapy.

A Novel ALK Secondary Mutation and EGFR Signaling Cause Resistance to ALK Kinase Inhibitors

Précis: Identifying mechanisms of resistance to targeted inhibitors represents a first step in developing second generation drugs and/or rationale combination therapies as potential clinical therapies for cancer patients.

DLL4-Notch Signaling Mediates Tumor Resistance to Anti-VEGF Therapy In Vivo
Ji-Liang Li, Richard C.A. Sainson, Chern Ein Oon, Helen Turley, Russell Leek, Helen Sheldon, Esther Bridges, Wen Shi, Cameron Snell, Emma T. Bowden, Herren Wu, Partha S. Chowdhury, Angela J. Russell, Craig P. Montgomery, Richard Paulsom, and Adrian L. Harris

Précis: Findings implicate the DLL4-Notch signaling pathway in mediating resistance to the widely administered antiangiogenic drug bevacizumab, suggesting that a combined blockade could enhance its efficacy.
## ABOUT THE COVER

Mast cells are best known for their primary involvement in allergic reactions, but have recently been reappraised as important players in either cancer promotion or inhibition. Pittoni and colleagues report that mast cells are enriched and degranulated in areas of adenocarcinoma in prostate tumor-bearing mice and patients, and foster tumor growth through MMP-9 provision. However, mast cell–targeted therapy in this setting has a dark side, originating from the previously unrecognized capacity of mast cells to control neuroendocrine prostate tumor variants. For details, see the article by Pittoni and colleagues on page 5987 of this issue.
