Highlights from Recent Cancer Literature

Dishonorable Discharge: The Oncogenic Roles of Cleaved E-Cadherin Fragments
Justin M. David and Ayyappan K. Rajasekaran

Targeting of a Conformationally Exposed, Tumor-Specific Epitope of EGFR as a Strategy for Cancer Therapy
Hui K. Gan, Antony W. Burgess, Andrew H. A. Clayton, and Andrew M. Scott

Mice Expressing Activated PI3K Rapidly Develop Advanced Colon Cancer
Alyssa A. Leystra, Dustin A. Deming, Christopher D. Zahm, Mohammed Farhoud, Terrah J. Paul Olson, Jamie N. Hadac, Laura A. Nettekoven, Dawn M. Albrecht, Linda Clipson, Ruth Sullivan, Mary Kay Washington, Jose R. Torrealba, Jamey P. Weichert, and Richard B. Halberg

Direct injection of immune-stimulatory genes into lymph nodes, where tolerance to tumor antigens occurs, may offer a powerful new kind of immunotherapy for cancer, given the marked clinical activity seen in early trials of this unique strategy to trigger antitumor immunity.

Expression of P2X7 Receptor Increases In Vivo Tumor Growth
Elena Adinolfi, Lizzia Raffaghello, Anna Lisa Giuliani, Luigi Cavazzini, Marina Capece, Paola Chiozzi, Giovanna Bianchi, Guido Kroemer, Vito Pistoia, and Francesco Di Virgilio

This study challenges the notion that immune effectors simply destroy targets and instead posits that they are involved in induction of tumor cell autophagy and resistance to anticancer therapy and potentially involved in repair.

TARGETED DELIVERY OF AN IMMUNE-STIMULATING FACTOR IN TUMORS USING A STEM CELL-BASED VECTOR CAN STANCH IMMUNE SUPPRESSION IN THE TUMOR MICROENVIRONMENT AND DECREASE ANTITUMOR IMMUNITY
Weibin Zou, Huilin Zheng, Tong-Chuan He, Jinjia Chang, Yang-Xin Fu, and Weimin Fan

In Vivo Imaging of Drug-Induced Mitochondrial Outer Membrane Permeabilization at Single-Cell Resolution
Sarah Earley, Claudio Vinegoni, Joshua Dunham, Rostic Gorbatov, Paolo Fumene Feruglio, and Ralph Weisleder

The ability to visualize and quantify drug-induced apoptosis of human tumor cells in vivo may address questions about how apoptosis is controlled by the tumor microenvironment.
### Inhibitory Roles of Signal Transducer and Activator of Transcription 3 in Antitumor Immunity during Carcinogen-Induced Lung Tumorigenesis

**Précis:** Tissue-specific genetic deletion of STAT3 in lung epithelium decreases susceptibility to lung carcinogenesis and promotes NK cell-mediated antitumor immunity, offering the first strong genetic proof for STAT3 signaling as a cancer therapeutic target for lung cancer treatment.

### MOLECULAR AND CELLULAR PATHOBIOLOGY

#### Vav3-Rac1 Signaling Regulates Prostate Cancer Metastasis with Elevated Vav3 Expression Correlating with Prostate Cancer Progression and Posttreatment Recurrence
Kai-Ti Lin, Jianli Gong, Chien-Feng Li, Te-Hsuan Jang, Wen-Ling Chen, Huei-Jane Chen, and Lu-Hai Wang

**Précis:** Findings highlight a cell adhesion signaling pathway that may contribute centrally to invasive metastasis of prostate cancer.

#### Stromal Estrogen Receptor-α Promotes Tumor Growth by Normalizing an Increased Angiogenesis
Christel Péqueux, Isabelle Raymond-Letron, Silvia Blacher, Frédéric Boudou, Marine Adlanmerini, Marie-José Fouque, Philippe Rochaix, Agnès Noël, Jean-Michel Foldart, André Krust, Pierre Chambon, Laurent Brouchet, Jean-François Arnal, and Françoise Lefant

**Précis:** Findings reveal that estrogens drive breast tumor growth in part by supporting the ability of endothelial cells in the tumor microenvironment, deepening our understanding of the molecular mechanisms involved in ER-positive tumorigenesis and how ER-positive tumors might be managed.

### THERAPEUTICS, TARGETS, AND CHEMICAL BIOLOGY

#### An NQO1 Substrate with Potent Antitumor Activity That Selectively Kills by PARP1-Induced Programmed Necrosis
Xiumei Huang, Ying Dong, Erik A. Bey, Jessica A. Kilgore, Joseph S. Bair, Long-Shan Li, Malena Patel, Elizabeth J. Parkinson, Yiguang Wang, Noelle S. Williams, Jimming Gao, Paul J. Hergenrother, and David A. Boothman

**Précis:** Therapeutic programmed necrosis can be achieved in tumors using bioactive substrates of the cytosolic NAD(P)H:quinone oxidoreductase 1 (NQO1) enzyme that is overexpressed in most solid cancers and can create extensive tumor-selective ROS bursts, damaging tumor cell DNA and rapidly killing cells.

#### MEK1/2 Inhibition Elicits Regression of Autochthonous Lung Tumors Induced by KRAS<sup>G12D</sup> or BRAF<sup>V600E</sup>
Christy L. Trejo, Joseph Juan, Silvestre Vicent, Alejandro Sweet-Cordero, and Martin McMahon

**Précis:** This study uses genetically engineered mouse models of human lung cancer to establish a preclinical proof of concept for MEK inhibitors as broadly effective therapy for lung tumors driven by activated Ras–Raf signaling.

### PREVENTION AND EPIDEMIOLOGY

#### Postmenopausal Hormone Therapy Is Associated with a Reduced Risk of Colorectal Cancer Lacking CDKN1A Expression
Jennifer H. Lin, Teppei Morikawa, Andrew T. Chan, Aya Kuchiba, Kaori Shima, Katsuhiko Nosho, Gregory Kerkner, Shumin M. Zhang, JoAnn E. Manson, Edward Giovannucci, Charles S. Fuchs, and Shuji Ogino

**Précis:** A reduction in colorectal cancer risk among U.S. women using postmenopausal hormone therapy may be due to the effect of these medications on a central cell-cycle regulator.

#### Adipokines Linking Obesity with Colorectal Cancer Risk in Postmenopausal Women
Gloria Y.F. Ho, Yao Wang, Marc J. Gunter, Howard D. Strickler, Mary Cushman, Robert C. Kaplan, Sylvia Wassertheil-Smoller, Xiaoxin Xin, Swapnil N. Rajpathak, Rowan T. Chlebowski, Mara Z. Vitolins, Philipp E. Scherer, and Thomas E. Rohan

**Précis:** A high level of leptin is an independent risk factor for colorectal cancer, and hyperleptinemia together with hyperinsulinemia may partially explain the association of obesity with colorectal cancer in postmenopausal women.

ABOUT THE COVER

Adenosine 5’-triphosphate (ATP) is a common constituent of the tumor microenvironment where it modulates the anticancer immune response and stimulates tumor cell growth and apoptosis. One of the main cellular receptors mediating these effects is the P2X7 receptor. P2X7 is an ATP-gated plasma membrane ion channel coupled to inflammasome activation, release of inflammatory cytokines, generation of reactive oxygen species, and stimulation of apoptosis. However, paradoxically, Adinolfi and colleagues found that tumorigenesis was accelerated by overexpression of P2X7 in several tumor models, and accordingly, drastically reduced by P2X7 silencing. Adinolfi and colleagues results provide a logical explanation for the intriguing finding that most human malignant tumors overexpress this receptor (a specimen from human differentiated colon cancer stained with an anti-P2X7 polyclonal antibody is shown). For details, see article by Adinolfi et al. on page 2957 of this issue.
