Highlights from Recent Cancer Literature

JNK-Induced Apoptosis, Compensatory Growth, and Cancer Stem Cells
Fei Chen

Metastasis-Associated Protein 1/Nucleosome Remodeling and Histone Deacetylase Complex in Cancer
Da-Qiang Li, Suresh B. Pakala, Sujit S. Nair, Jeyanthi Eswaran, and Rakesh Kumar

Stress-Regulated Transcription Factor ATF4 Promotes Neoplastic Transformation by Suppressing Expression of the INK4a/ARF Cell Senescence Factors
Michiko Horiguchi, Satoru Koyanagi, Akinori Okamoto, Satoshi O. Suzuki, Naoya Matsunaga, and Shigehiro Ohdo

Increased Survival of Glioblastoma Patients Who Respond to Antiangiogenic Therapy with Elevated Blood Perfusion
A. Gregory Sorensen, Kyrre E. Emblem, Pavlina Polaskova, Dominique Jennings, Heisoo Kim, Marek Ancukiewicz, Meryun Wang, Patrick Y. Wen, Percy Ivy, Tracy T. Batchelor, and Rakesh K. Jain

Regulation of Matrix Metalloproteinase Genes by E2F Transcription Factors: Rb–Raf-1 Interaction as a Novel Target for Metastatic Disease
Jackie L. Johnson, Smitha Pillai, Danielle Pernazza, Sáid M. Sebti, Nicholas J. Lawrence, and Srikumar P. Chellappan

Précis: Matrix metalloproteases regulated by the Rb–E2F pathway may serve as its major connection to invasion and metastasis control, with implications for therapeutic intervention such as through targeting the Rb–Raf-1 interaction as illustrated in this study.

Androgen Deprivation Causes Epithelial–Mesenchymal Transition in the Prostate: Implications for Androgen-Deprivation Therapy
Yuting Sun, Bu-Er Wang, Kevin G. Leong, Peng Yue, Li Li, Suchit Jhunjhunwala, Darrell Chen, Kyounghee Seo, Zora Modrusan, Wei-Qiang Gao, Jeffrey Settleman, and Leisa Johnson

Précis: Findings argue that androgen-deprivation therapy, used widely in prostate cancer treatment, can trigger epithelial–mesenchymal transition, a foreboding event that may detract from the response to other treatments.

Hyaluronan Synthase HAS2 Promotes Tumor Progression in Bone by Stimulating the Interaction of Breast Cancer Stem–Like Cells with Macrophages and Stromal Cells

Précis: Findings define a mechanism used by cancer stem cells to produce an extracellular matrix glycosaminoglycan that may help seed a metastatic niche in foreign organ microenvironments, with major implications for antimetastatic therapy.

Correction: CD8+ T Cells Regulate Bone Tumor Burden Independent of Osteoclast Resorption

Metastatic Progression with Resistance to Aromatase Inhibitors Is Driven by the Steroid Receptor Coactivator SRC-1
Jean McBryan, Sarah M. Theissen, Christopher Byrne, Eamon Hughes, Sinead Cocchiglia, Stephen Sande, Jane O’Hara, Paul Tibbitts, Arnold D.K. Hill, and Leonie S. Young

Précis: This study reveals insights into the mechanism by which clinical resistance and metastatic progression occur with aromatase inhibitors, a first-line treatment for endocrine-sensitive breast cancers.

p53 Negatively Regulates Transcription of the Pyruvate Dehydrogenase Kinase Pdk2
Tanupriya Contractor and Chris R. Harris

Précis: This study reveals how p53 controls the Warburg effect, a universal property of cancer cells in which glycolysis is driven powerfully despite aerobic conditions that should otherwise favor oxidative phosphorylation.
ABOUT THE COVER

Epithelial–mesenchymal transition (EMT) is a key developmental process and has also been implicated in cancer metastasis and therapeutic resistance. The factors contributing to EMT in human cancers remain unclear. Sun and colleagues show that androgen deprivation can promote EMT in normal mouse prostate as well as in human prostate cancer, revealing a potentially important consequence of a standard of care treatment for prostate malignancies. This image corresponds to an immunofluorescence staining of E-cadherin (epithelial marker) and vimentin (mesenchymal marker) in postcastration (androgen-deprived) mouse prostate tissue. Cells that express both markers are likely to be undergoing EMT. Red, Vimentin; green, E-cadherin; blue, DAPI. For details, see the article by Sun and colleagues on page 527 of this issue.
