Précis: This important study provides a preclinical proof-of-concept for administering clinically approved PPARα agonists to treat lung cancer, with immediate implications to reposition an existing drug treatment that is well tolerated and may be highly efficacious in this setting.

ABOUT THE COVER

Anthracycline-based chemotherapy promotes the recruitment of CD11c+ (green) CD86+ (red) dendritic cells in close proximity to Caspase 3a+ (magenta) dying tumor cells. This process relies on “eat me” signal ATP and CCL2/CCR2 chemotactic axis. For details, see the article by Ma and colleagues on page 436 of this issue.
