Figure S1. Predicted human C5ORF35 is not conserved in rats. Panel A: Predicted C5ORF35 transcript was detected in multiple human tissues by RT-PCR. Panel B: Splice variants of C5ORF35 detected in human tissue and sequence similarity between human C5ORF35 exons and other species. A C5ORF35 splice variant that did not contain exon 2 was detected in human thymus and spleen samples. C5ORF35 is not conserved between primates and rodents based on degeneration of 5’ and 3’UTR sequences in rodents.
