She's a graduate of Columbia with a Masters in literature.

She's a vice president of a publishing company.

She's watched television programs and read dozens of pamphlets and articles about early cancer detection.

She has relatives and close, personal friends who have had mastectomies.

She's about as aware of the need for breast self-examination as any intelligent woman could be.

Yet she does not get regular checkups nor does she even examine her own breasts.

Why? Because her doctor never told her to.

But 92% of the women who receive personal instruction from their doctors *do* regularly practice BSE.*

You don't have to be told how important early detection is. But maybe you need this reminder that a few personal words from you can often mean more than the millions of words that go into publicity and television programs.

*Based on a Gallup study conducted for the American Cancer Society.
