## ABOUT THE COVER

Subpopulations of osteotropic human prostate cancer cells were isolated by viable cell sorting based on aldehyde dehydrogenase activity (ALDH). The ALDH<sup>high</sup> subpopulation of prostate cancer cells readily formed metastasis and strongly grows in bone marrow (upper panel), whereas the ALDH<sup>low</sup> cells display no or very limited growth (lower panel). The findings by van den Hoogen and colleagues suggest that ALDH activity can be used to identify and characterize tumor- and metastasis-initiating cells in human prostate cancer. For details, see the article by van den Hoogen and colleagues on page 5163 of this issue.
