

Figure S5. Characterization of circulating CFU-F. Adherent GFP+CD31-CD45-CD34+ cells recovered from PBMC of obese tumor-bearing GFP/RFP chimeras were allowed to expand in culture. Then cells were fixed, permeabilized and subjected to immunofluorescence analysis with rabbit anti-collagen I (Abcam), rat anti- α SMA (Sigma), rabbit anti-decorin and rat anti-F4/80 (Abcam) antibodies or IgG negative control. Secondary Cy-3-conjugated antibody signal is red. Nuclei are blue.
